

Oracle® E-Business Suite Connector

Redwood Extensions: WorkloadConnect Library

At A Glance

Features

- Automated management of Oracle E-Business Suite workload
- Centralized control of external interfaces from Oracle E-Business Suite
- Web-based monitoring of Oracle job completion status and output data

Benefits

- Tight process integration across application boundaries improves service level delivery
- Elimination of latency between tasks from different environments increases efficiency
- Single management interface reduces training requirements and improves productivity

Advantages

- Leverage the only fully Web-architected and platform-agnostic workload automation solution
- Manage and integrate complex multi-platform processes through a single intuitive interface
- Future-proof your workload management environment with a flexible, event-driven architecture

Oracle® E-Business Suite Workload

Whether running financial period close, invoicing or general ledger, Oracle® E-Business Suite is a vital part of your business application environment. For most organizations, Oracle E-Business Suite is just one of several business applications that must work together to deliver the accurate and timely information that the business demands. With core business processes often spanning these applications, coordinating individual tasks within and between them is critical to running your enterprise. Whether running Cronacle or SAP Central Process Scheduling, the Redwood connector for Oracle E-Business Suite is your key to ensuring that Oracle application processes are easily managed and integrated, helping you to maximize return on your Oracle investment.

Reliable Automation Accelerates Oracle Processes

The Redwood connector for Oracle E-Business Suite submits Oracle application tasks, tracks status, and makes output information available for use with other automated processes, as well as for immediate decision making. Incorporating Oracle E-Business Suite tasks within the high-speed, centralized Cronacle or SAP Central Process Scheduling automation infrastructure ensures reliable execution, management and monitoring of the IT workload that underpins your business processes.

In addition, integrating Oracle E-Business Suite tasks into the wider processing

environment eliminates the restrictions inherent in its native scheduling tool, Oracle® Concurrent Manager. Redwood's fully dynamic, event-driven scheduling and automation accelerates your end-to-end Oracle E-Business Suite processing. Oracle application jobs can be released or triggered based on non-Oracle events or processes. Reusable job definitions provide improved reliability and ensure minimal administration overhead. The Redwood connector for Oracle E-Business Suite lets you manage complex Oracle tasks from the same user-friendly Web-based interface as the rest of your application workload, as well as easily control interfaces to external environments from the Oracle application.

Oracle® E-Business Suite Connector

Redwood Extensions: WorkloadConnect Library

Centralized Management Enhances Productivity

The Redwood connector for Oracle E-Business Suite requires no additional software on the Cronacle or SAP Central Process Scheduling server. Using the standard Oracle JDBC driver to connect to the remote Oracle application via Oracle SQL*Net, jobs are submitted securely using authorized credentials. Jobs for the Oracle application are set up using a supplied template, allowing you to set Oracle job parameters from the central management console – and get your E-Business Suite processes automated quickly and easily.

With the Redwood connector for Oracle E-Business Suite, your IT staff can manage and control business-critical tasks without having extensive knowledge of the application environment – keeping productivity high while controlling personnel costs. The dynamic resource management and load balancing features of Cronacle and SAP Central Process Scheduling provide further efficiencies. Multiple parallel processes can be submitted simultaneously, maximizing resource use and ensuring the highest levels of process execution in the time available.

Oracle E-Business Suite workload management is no longer performed in isolation. Fully integrated with related tasks from other packaged and in-house applications, you can more fully leverage the value of your Oracle technology.

Take Your Environment Beyond Process Automation

Cronacle and SAP Central Process Scheduling take you beyond just centralized control of Oracle E-Business Suite. Your Redwood solution enables you to build a proactive automation infrastructure that manages and monitors enterprise workloads and the IT infrastructure that supports them. Now you can catch potential problems – such as a database table space shortage or missing services – and take appropriate action before they can impact business. This active management approach ensures the overall health of your end-to-end process automation environment, so Oracle E-Business Suite—and all critical processes—run smoothly and reliably, improving service delivery to your users.

Maximize. Streamline. Simplify.

Redwood's comprehensive WorkloadConnect Library enables Cronacle and SAP Central Process Scheduling to act as the master workload management system for your entire enterprise, addressing every major platform and application. Redwood process automation solutions enable you to maximize resources, streamline complex processes, and dramatically simplify workload administration.
